

Figure 1. Top View

Figure 2. Bottom View

Feature

- Provides three biases for IQ modulators
- Modulation format independent:
QPSK, QAM, OFDM, SSB verified
- Plug and Play:
No manual calibration needed
Everything automatic
- I, Q arms: controll on Peak and Null modes
High extinction ratio: 50dB max¹
- P arm: controll on Q+ and Q- modes
Accuracy: $\pm 2^\circ$
- Low profile: 40mm(W) \times 29mm(D) \times 12mm(H)
- High stability: fully digital implementation
- Easy to use:
Manual operation with mini jumper
Flexible OEM operations through UART²
- Two modes to provide bias voltages:
 - a. Automatic Bias Control
 - b. User defined bias voltage

Application

- LiNbO₃ and other IQ modulators
- QPSK, QAM, OFDM, SSB and etc
- Coherent Transmission

Ordering Information

Part No.: MBC-IQ-03

Introduction

An IQ modulator consists of three different modulators: I, Q arms are intensity modulators, P arm is a phase modulator. The IQ modulator is typically applied to coherent transmission systems. Plugtech Precision Systems' modulator bias controller is specially designed for IQ modulators to ensure a stable operation state in various operating environments. Based on its fully digitized signal processing method, the controller can provide ultra stable performance.

The controller injects a low frequency, low amplitude dither signal together with a bias voltage into the modulator. It keeps reading the output from the modulator and determines the condition of the bias voltage and the related error. A compensate bias voltage will be applied afterwards according to the previous measurements. In this way, the IQ modulator is ensured to work under a proper bias voltage.

The controller is very compact in volume, and is suitable for modern communication systems.

¹ The highest extinction ratio depends on and cannot exceed the system modulator maximum extinction ratio.

² UART operation is only available on some version of the controller.

Specifications

Parameter	Min	Typ	Max	Unit
Controll Performance				
I, Q arms are controlled on Null(Minimum) or Peak(Maximum) point				
Extinction ratio		MER ¹	50	dB
P arm is controlled on Q+(right quadrature) or Q-(left quadrature) point				
Accuracy at Quad	-2		+2	degree ²
Stablization time	15	20	25	s
Electrical				
Positive power voltage	+14.5	+15	+15.5	V
Positive power current	20		30	mA
Negative power voltage	-15.5	-15	-14.5	V
Negative power current	8		15	mA
Output voltage range	-14.5		+14.5	V
Dither amplitude		1% V_{π}		V
Optical				
Input optical power ³	-30		-8	dBm
Input wavelength	1100		1650	nm

¹ MER refers to intrinsic Modulator Extinction Ratio. The extinction ratio achieved is typically the extinction ratio of the modulator specified in modulator datasheet.

² Let V_{π} denote the bias voltage at 180° and V_P denote the most optimized bias voltage at Quad points. Then the controller bias voltage output will be in the range of: $V_P \pm \frac{2^{\circ}}{180^{\circ}} V_{\pi}$

³ Please be noted that the input optical power does not refer to the optical power at the selected bias point. It is the maximum optical power that the modulator can export to the controller when the bias voltage ranges from $-V_{\pi}$ to $+V_{\pi}$.

Figure 9. Controller with adaptor

User Interface

Figure 10. Assembly

Group	Operation	Explanation
Reset	Insert jumper and pull out after 1 second	Reset the controller
Power	Power source for bias controller	V- connects the negative electrode of the power supply
		V+ connects the positive electrode of the power supply
		Middle port connects with the ground electrode
Polar ¹	PLRI: Insert or pull out the jumper	no jumper: Null mode; with jumper: Peak mode
	PLRQ: Insert or pull out the jumper	no jumper: Null mode; with jumper: Peak mode
	PLRP: Insert or pull out the jumper	no jumper: Q+ mode; with jumper: Q- mode
LED	Constantly on	Working under stable state
	On-off or off-on every 0.2s	Processing data and searching for controlling point
	On-off or off-on every 1s	Input optical power is too weak
	On-off or off-on every 3s	Input optical power is too strong
PD ²	Connect with the photodiode	PD port connects the Cathode of the photodiode
		GND port connects the Anode of the photodiode
Bias Voltages	In, Ip: Bias voltage for I arm	Ip: Positive side; In: Negative side or ground
	Qn, Qp: Bias voltage for Q arm	Qp: Positive side; Qn: Negative side or ground
	Pn, Pp: Bias voltage for P arm	Pp: Positive side; Pn: Negative side or ground
UART	Operate controller via UART	3.3: 3.3V reference voltage
		GND: Ground
		RX: Receive of controller
		TX: Transmit of controller

¹ Polar depends on system RF signal. When there is no RF signal in the system, the polar should be positive. When RF signal has amplitude greater than a certain level, the polar will change from positive into negative. At this time, Null point and Peak point will switch with each other. Q+ point and Q- point will switch with each other as well. Polar switch enables user to change the polar directly without changing operation points.

² Only one choice shall be chosen between using controller photodiode or using modulator photodiode. It is recommended to use controller photodiode for Lab experiments for two reasons. Firstly, controller photodiode has ensured qualities. Secondly, it is easier to adjust the input light intensity. If using modulator's internal photodiode, please make sure that the output current of photodiode is strictly proportional to input power.

UART Command List

UART of the controller works at TTL(3.3V) level with following parameters: 57600 baud rate, 8 data bits, no parity bit, 1 stop bit.

Note: UART control is an additional feature for bias controller. Only those model number ended with 'A' (for example, MBC-IQ-03A) support UART control.

Description	Command ID ¹	Data Send ¹	Data Received ²	Unit
Get optical power ³	0x65	NA	Current optical power ⁴	μ W
Get bias voltage	0x66	Arm ⁵	Current bias voltage ⁴	V
Get V_{π}	0x67	Arm ⁵	Modulator V_{π} ⁴	V
Get polar	0x68	NA	Current polar of controller ⁶	
Get operating status ⁷	0x69	NA	Controller operating status ⁸	
Set control mode	0x6A	Control mode ⁹	Status ¹⁰	
Set output voltage ¹¹	0x6B	Arm ⁵ + Voltage ¹²	Status ¹⁰	
Set polar	0x6C	Polar ¹³	Status ¹⁰	
System reset ¹⁴	0x6D	NA	NA	
Set Dither Amplitude ¹⁵	0x6F	Dither Amplitude ¹⁶	Status ¹⁰	
Pause Control ¹⁷	0x73	NA	Status ¹⁰	
Resume Control ¹⁸	0x74	NA	Status ¹⁰	

¹ Bias controller can be controlled by a master device, such as a microprocessor, through UART. Command ID and Data Send refer to the data sent by master device. Each command should be sent in a frame of 7 bytes following the sequence of Command ID(1 byte) + Data(6 bytes). For data bytes, it should be filled from the first byte and unused data bytes should be zero.

² Data received refer to the data received by master device. For data received, it has a frame of 9 bytes following the sequence of Command ID(1 byte)+Data(8 bytes). Similar to data send, received data bytes will be filled from the first byte and unused data bytes will be filled with zero.

³ The average power corresponds to the optical power which inputs into the controller.

⁴ Data received is 4 byte floating point number(Little Endian).

⁵ Arm of the IQ modulator. (0x01: Arm I; 0x02: Arm Q; 0x03: Arm P)

⁶ Three bytes will be received. Each byte represents polar of one arm. Byte one is polar of arm I, byte two is polar of arm Q and byte three is polar of arm P.

⁷ There might be a delay not exceeding 3s between the controller receives this command and send back data when the controller is in stabilizing status.

⁸ Received data is one byte long. (0x01: Stabilizing; 0x02: Stabilized; 0x03: Light too weak; 0x04: Light too strong; 0x05: Manual state)

⁹ Control mode is one byte. (0x01: Auto Control; 0x02: Manual Control)

¹⁰ One byte. (0x11: Success; 0x88: Error)

¹¹ Set output voltage function can only be used when bias controller is working under manual mode. Due to the accuracy and non-linearity of DAC, there is an error not exceeding 20mV when using this function.

¹² Three bytes. For example, if 3.215V is required for output, the voltage should be multiplied by 1000 to convert the value to integer, i.e. 3215. Then convert 3215 to hex format. Hex format of 3215 is 0x0C8F. Byte one is the upper half of the final hex result, i.e. 0x0C. Byte two is the lower half, i.e. 0x8F. Byte three is sign of the voltage, 0x00 for positive, 0x01 for negative.

¹³ Three bytes. These bytes are used to represent polar of arm I, Q and P. (0x01: Positive; 0x02: Negative)

¹⁴ Reset the controller. It will start from initialization.

¹⁵ Set dither amplitude on arm I and Q. It can only be the multiple of 1% V_{π} and maximum dither amplitude is 20%. For example, if dither amplitude of arm I is set to be 3. Then dither amplitude on arm I will be 3%. The amplitude's factory default value is 1, when user set a new value to the controller, it will be stored in Flash memory and automatically loaded when the controller is turned on or reset.

MBC-IQ-03

¹⁶ Two bytes. Format of the data is dither amplitude I + dither amplitude Q. One byte for each arm.

¹⁷ This function will pause the controller's automatic control. Dither will be stopped and bias voltage output of arm I,Q and P will remain at the value when the pause command is executed.

¹⁸ This function is used together with Pause Control. When pause control is executed and the automatic control is needed, executing this command will resume automatic control.

Environmental Characteristics

Parameter	Min	Typ	Max	Unit
Operating temperature	-10		50	°C
Storage temperature	-20		80	°C

Dimension

Parameter	Value
Dimensions (W× D× H)	40mm× 29mm × 12mm
Weight	100g

Typical Application

The controller is easy to use.

Step1. Connect 1% port of the coupler to the photodiode of the controller.

Step2. Connect bias voltage output of the controller(through SMA or 2.54mm 2-pin header) with bias port of the modulators (I, Q and P).

Step3. Provide controller with +15V and –15V DC voltages.

Step4. Insert the jumper and pull out after 1 second, the controller will be reseted and start to work.

NOTE 1. Please be ensured that RF signal of the whole system is on before pressing RESET button.

NOTE 2. If the controller indicates the input light is too weak or too strong, the input light intensity shall be adjusted. After adjustment, controller shall be restarted to ensure proper operation.

This is an electrostatic-sensitive device. Please observe precautions for handling

Revision History

Version	Content	Date
1.0.0	First Release	2015-Apr
1.1.0	Minor modifications. Add performance pictures	2015-May
1.1.1	Minor modifications on wordings	2015-Sep
1.1.2	Product size update	2015-Oct
1.1.3	Add UART section	2015-Nov
2.0.0	Updated to MBC-IQ-02: lower current consumption	2015-Dec
2.0.1	Add UART settings description.	2016-Mar
2.0.2	Consolidate UART function description.	2016-May
2.0.3	Update current on specification table	2016-Sep
2.0.4	Update part no. and contact	2016-Oct
2.0.5	Update restriction on internal PD of modulator. Update accuracy of manual set DAC output function.	2016-Dec
2.0.6	Update UART section	2017-Mar
2.0.7	Update UART section and connection diagram	2017-Aug
2.0.8	Update User Interface Description	2020-Feb
2.0.9	Update UART Note section	2020-May
2.1.0	Update Dimension Information	2020-Dec
